

I am a ham operator and am very concerned about the FCC possibly approving BPL. In the several areas where trials have been run, there have been many instances where several of the ham bands were rendered just about useless for any meaningful communication. these cases have been documented on tape and video.

The power companies propose to fix any problems which might occur because of BPL. They can barely keep up with the various RFI complaints that come in because of broken lightning arrestors and other equipment. If they can't keep up with these simple remedies, how in the world will they be able to take care of the multitude of problems which will surface across the radio spectrum?
